

# Mayan Writing

Deciphering the Mayan writing has proven to be a harder task than anticipated by the early investigations. After almost two hundred years, very little of it was actually understood. It has been only in the last three decades that real advances have been made. Mayan writing is based on small drawings known as glyphs which represent sounds. Mayan words are normally written as glyphs put together at various positions. One of several problems in deciphering Mayan writing arises in the order of reading. When placing several glyphs in order to form a word, Mayan writers sometimes decided the position based more on their own esthetic views than on any particular rule. This leads to the fact that, even though the sound for many glyphs is known, sometimes archaeologists are not sure how to pronounce a written word. The archaeologists are looking for a special word  $W$ . They know the glyphs for it, but they don't know all the possible ways of arranging them. Since they knew you were doing INF237 this semester, they have asked for your help. They will provide you with the  $g$  glyphs from  $W$  and a sequence  $S$  of all the glyphs (in the order they appear) in the carvings they are studying. Help them by counting the number of possible appearances of the word  $W$ .

Write a program that, given the glyphs for  $W$  and the sequence  $S$  of glyphs in the carvings, counts the number of possible appearances of  $W$  in  $S$ ; that is, every sequence of consecutive  $g$  glyphs in  $S$  that is a permutation of the glyphs in  $W$ .

## Input

The first line contains 2 space-separated integers that represent  $g$  and  $|S|$ . Then follows a line containing  $g$  consecutive characters that represent the glyphs in  $W$ . Valid characters are a-z and A-Z; uppercase and lowercase characters are considered different. The last line contains  $|S|$  consecutive characters that represent the glyphs in the carvings. Valid characters are a-z and A-Z; uppercase and lowercase characters are considered different. You can assume  $1 \leq g \leq 3000$  and  $g \leq |S| \leq 3000000$ .

## Output

Your program is to output the number of possible appearances of  $W$  in  $S$ .

### Sample Input 1

```
4 11
cAda
AbrAcadAbRa
```

### Sample Output 1

```
2
